- Export and download of video with its metadata
- Support multiple playback speeds
- Video playback
- User-friendly GUI

The Sirius v-Live platform is a video communication service that enhances emergency voice calls. The system allows officers to establish a dedicated live video stream from the caller's mobile phone to the emergency call center.

This solution enhances the capability for officers to sense-making and makes the right decisions on the resource and relevant operations to be activated to the incident scene.

In addition, emergency ground officers can receive real-time situational awareness of the incident through the Sirius v-Live platform by the sharing of the live video stream.
